

ABSTRACT

Systems and methods are disclosed for visualizing business agreement interactions. One method embodiment comprises: displaying one or more parties of a first type as nodes in a first region of a view window; displaying one or more parties of a second type as nodes in a second region of the view window; displaying one or more parties of a third type as nodes in a third region that is at least substantially between the first and second region; and displaying agreements between parties as lines between corresponding nodes. The lines may be displayed with at least one characteristic indicative of when a violation of a represented agreement condition has occurred.
